Sodium/potassium-ransporting Afpase beta-233 chain (Sodium/potassium-ransporting Afpase beta-233 chain (Sodium/potassium-ransporting Afpase beta-233 subunit).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cutler C.P., Brezillon S., Bekir S., Sanders I.L., Hazon N., Cramb G., "Expression of a duplicate Na, K-ATPase beta(1)-isoform in the European eel (Anguilla anguilla).";
Am. J. Physiol. 279:R222-R229(2000).
-!- FUNCTION: This is the non-catalytic component of the active enzyme, which catalyzes the hydrolysis of ATP coupled with the exchange of Na (+) and K(+) ions across the plassma membrane.
-!- SUBUNIT: Composed of three subunits: alpha (catalytic), beta and

-!- TISSUE SPECIFICITY: Expressed mainly in epithelial tissues.
-!- SIMILARITY: Belongs to the Na+/K+ and H+/K+ ATPases beta chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        family.

The invention relates to a human monoclonal antibody or its antigen binding fragments, which exhibit immunological binding affinity for a hepatitis C virus (HCV) El antigen, comprising an amino acid sequence homologous to the binding portion of a human antibody Fab molecule from combinatorial antibody library. The vaccine composition comprising the antibodies or antigen binding fragments against HCV El or E2 antigen or its hypervariable region is useful in treating or preventing HCV infection in a subject. Sequences AGG76513-ABG76568 represent human monoclonal antibodies against HCV El antigen

New molecular conjugate having a monoclonal antibody that binds to human APCs linked to a beta human chorionic gonadotropin, useful for inducing a

comprises a heavy and/or light chain articlaspen presenting cells (APCBS) inheed to beta human chorionic gonadotropian (betahCG), where the antibody comprises a heavy and/or light chain variable region derived from a human (YB5-51 or VK-LIS germline sequence with the 98 or 95 amino acid sequences (TB5-51 or VK-LIS germline sequence with the 98 or 95 amino acid sequences (CC CBEQ ID NO:30 or 32 (ABCR4684), respectively, Also described: (1) a molecular conjugate comprising a human antibody heavy chain and a human antibody light chain, where either or both chains are linked to betahCG; (2) a molecular conjugate comprising a human single comprises the 411 amino acid sequence of SEQ ID NO:12 (ADCR46829); (3) a composition comprising any of the molecular conjugates as described above, and a carrier, optionally in combination with an adjained betahCG, comprising or enhancing a T cell-mediated immune response, against betahCG, comprising contacting any of the molecular conjugates described above with APCE such that the antigen is processed and carrier, or comprising administering any of the molecular conjugates comprising administering any of the molecular conjugates or presented to T cells in a manner which induces or enhances a T cell-mediated above with APCE such that the molecular conjugates described above, comprising any of the molecular conjugates described above, with APCE such that the antigen. (6) immunostimulatory agent; and (6) inducinally in combination with an adjuvant, a cytokine which stimulates proliferation of dendritic cells and/or an immunostimulatory agent; and conjugate of the antigen and a monoclonal antibody which binds to APCE, and contacting the conjugate either in vivo or exvivo with APCE such that the antigen if membraces a cytotoxic T cell response against the antigen. The molecular conjugate has cytotoxic tricke and antimalarial activities and conjugate of the antigen and a monoclonal antibody which binds to APCE, and confuce and conjugate of and in particular conjugate of the antigen and eliciting a potent antigen-specific cytotoxic T lymphocyte response, including melanoma, fibrosarcoma, leukaemia, HIV, heparlitis, malaria and herpes. The present sequence represents a human pBl1-betahCG molecular conjugate, which is used in the exemplification of the present invention. present invention describes a molecular conjugate comprising a ocional antibody that binds to human antigen presenting cells (APCs) cytotoxic T cell response in cancers and infectious diseases Claim 16; SEQ ID NO 12; 82pp; English Sequence 411 AA;

```
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antigen on the surface of an adipocyte to detect or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      determine the presence or level of adipocytes in a cell of tissue sample. The antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodies for fulfiferent types of fat deposits and also be produced e.g. intraabdominal fat associated with heart disease

their active domains. The polypectides encoting and intentions of their active domains. The polypectides of olymentides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the abbrrant protein care superson or activity. The polypeptides can be used as molecular weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides or used to identify compounds which bind to the polypeptides.

The polypeptides of the invention are used as probes and primers, for sequencing, for crombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein antibodies at issue markers, and to isolate receptors or ligands.

Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon,

This sequence is the consensus VH5 domain of an anti-CD4 antibody (Ab). This sequence can be used in the method of the invention for treating a mubject, where the treatment comprises administration of an Ab. The method comprises the administration of an antibody which has an Old World monkey (e.g. baboon or macaque) variable region which binds to an antigen (Ag) (or Ag binding portion), and a human constant domain. The method is useful for the treatment of ecreme and immuno-modulated diseases and especially rheumatoid arthritis. The recombinant antibodies used are sufficiently different from native monkey antibodies to allow human antibodies used in therapy in prior art, these antibodies do not induce human anti-antibodies used in therapy in prior art, these antibodies do not induce human anti-antibodies on repeated administration. They also have longer half-lives and do not have a lack of effector function with human cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; Fv molecule; hypervariable region; single chain Fv; cytostatic; disulfide Fv; dsFv; scFv; cancer; carcinoma; sarcoma; leukaemia; adenoma; lymphoma; myeloma; blastoma; seminoma; melanoma; acute myeloid leukaemia.

characteristics so as to selectively bind target cell in favor of other Claim 13; Page 205; 232pp; English. 

The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is chain Fv (acFv) or a disulfide Fv (aFv). The peptide, optionally in sesociation with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, as accoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region created peptide of the invention

(BIOT-) BIO-TECHNOLOGY GEN CORP.

Levanon A; Szanton E, Guy R, Lipschitz O, Hagai Y, Lazarovits J, Plaksin D, Peretz T; 

The invention relates to a peptide or polypeptide comprising an Fy molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myeloma, bastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region related peptide of the invention Novel peptide/polypeptide for cancer therapy has Fv molecule, construct or fragment, or construct of fragment with enhanced binding characteristics so as to selectively bind target cell in favor of other Claim 13; Page 204; 232pp; English WPI; 2002-619166/66.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                임
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8
                                                                                                                                                                                                                                                                       The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15 GlyGluSerLeuLysIleSerCysLysGlySerGlyTyr-SerPheThrSerTyrTrpIl 34

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one artibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases cantionadus diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases caused by sulphated tyrosine-dependent protein-cells in interactions. This sequence represents a human antibody fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              47

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complete being bound by an antibody, its antigen-binding fragment or its complete being bound by an antibody, its antigen-binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune disease, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, for increasing mortality of tumour or leukaemia dents. The disease cells for increasing the susceptibility of diseased cells to decreasing the number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to for decreasing the number of tumour or leukaemia cells, for increasing the anticance or anticoned purposes. The epitopes are useful for diseases, inflammatory diseases such as cancer, leukaemia, autoimmune diseases, inflammatory cells singular diseases such as mentically infarction, cretinopathic diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-

of the interactions. This sequence represents a human antibody fragment
                                                                                                                       Human; antibody; epitope; cancer; tumour; cell rolling; inflammation; metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease; cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plaksin D, Vogel T, Nimrod A, Mar-Haim H;

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one attibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune cepitopes are useful for inhibiting cell rolling, inflammation, autoimmune tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anticortality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to decreasing the number of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for diseases, inflammatory diseases such as myocardial infarction, cretinopathic diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-

immunoglobulin variable region. The first and second Old World monkey can be the same or different. The recombinant antibody is useful for treating a human having the antigen described above, e.g. for treating cancer in a human having a tumour antigen, or for treating a human suffering from an autoimmune response (where the antigen is involved in an autoimmune response in the human). In particular, the recombinant antibody is useful for treating rheumatoid arthritis, eczema, or an immunomodulatory disease. The recombinant antibody is also useful for treating tumours, leukaemia, lymphoma, Hashimoto's thyroiditis, autoimmune carditis, Addison's disease, type I-diabetes mellitus, multiple sclerosis, male infertility, autoimmune hemolytic ansemia, inflammarory bowel disease, Sjogren's syndrome, psoriasis, or systemic lupus erythematosus. This is sloslypeptide for creation of the recombinant antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying and obtaining inhibitor of a pathological process for treating e.g. autoimmunity comprises determining if a compound is capable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    47
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21

```

Constructing a library of recombinant antibodies useful as source of antibody candidates for screening antigens comprises clustering variable regions of antibodies having known 3-dimensional structures into

structural ensembles.

```
The present invention describes a method for identifying and obtaining an inhibitor of a pathological process. The method comprises determining if a compound is capable of modulating the binding of the Rc-epsilon-R1 receptor alpha-chain and an autoantibody against the Rc-epsilon-R1 receptor alpha-chain for identifying and obtaining an inhibitor of a pathological process; (2) use of the identified inhibitor for inhibiting activity of the autoantibody against the Rc-epsilon-R1 receptor alpha-chain, and (3) a compound identified by the method, which binds but does not activate the autoantibody against the Rc-epsilon-R1 receptor alpha-chain. The method is useful for obtaining an inhibitor of a pathological process e.g. imbalance between cell-bound and free IgE e.g. allergic disease (urticaria, late phase allergic reactions, intrinsic asthma, drug intolerance and food intolerance). IgE mediated disease or malignancy. The compound is useful for treating a pathological process, particularly conditional autoimmunity. The present sequence have been an abana recombinant anti-Fc-epsilon-R1 alpha autoantibody beautoantibody against the presents and the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      7

The invention relates to a novel method for the construction of a library of recombinant antibodies. The novel method comprises clustering variable regions of a collection of antibodies having known 3D structures into at least two families of structural ensembles, each comprising at least two different antibody sequences but with substantially identical main chain conformations. The method is useful for constructing a library of artificial antibodies in silico which provides a structurally diverse and yet functionally more relevant source of antibody candidates which then be screened for binding a wide variety of target molecules, including small molecules, and biomacromolecules such as proteins, poppides and nucleic acids. The libraries constructed are useful as a Source of antibody candidates for further screening for novel antibodies with high affainty against a wide range of antigens and having no or minimum immunogenecity to human subjects treated with antibody therapeutics. This sequence repersents a human peptide region of an antibody relating to the novel antibody library construction method of 21 54 47 34 eGlyTrpValArgGlnMetProGlyLysGlyLeuGluTrpMetGlyIleIleTyrProGl -----AGCTGGTTAGCCATCTATCTTGG Human germline heavy chain variable region gene segment #45. ```
comprising making chimeric antibodies containing a complementarity determining making chimeric antibodies containing a complementarity determining region (CDR) from a non-human antibody and appropriate framework sequences (I) of human antibodies. (I) is selected by using canonical CDR structure types of non-human antibody in comparison to germline canonical CDR structure types of human antibodies as the basis for selection, for humanisation. The method is useful for making a for selection, for humanised antibody of sequence of any subject species to a less immunogenic form suitable for use in an object species to a less immunogenic form suitable for use in an object species to a less converting a subject antibody sequence of any subject species to a less immunogenic form suitable for use in an object species that retain con-human CDR regions and to provide humanisch antibodies that retain this antitable human for sequences to support of for direct comparison of framework sequences, without the need for determining critically important amino acid residues in the framework, and without the need for multiple iteration and construction to obtain humanised antibodies with suitable therapeutic properties. The antibody has high affinity and low immunogenicity without need for comparing framework sequences between non-human antibodies. This sequence represents a human heavy chain variable region gene segment used in the creation of humanised antibodies
                                                                                                                                                                                                                                                              Making humanized antibody for converting antibody, by making chimeric antibodies containing complementarity determining region from non-human antibody and appropriate framework sequences of human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a method of making a humanised antibody
